FLEXWORK

DIGITAL QA HIGH-LEVEL TEST PLAN

Applications: ACET | BEO | SPIRE | OAP

Project: FlexWork Product on USP
Document Type: High-Level QA Test Plan | Version: 1.0

Purpose
Define the high-level Digital QA approach, application scope, test coverage, integration touchpoints, dependencies and completion criteria for FlexWork across the four identified digital applications.

Prepared for Digital QA review

1. Project Overview

The objective of this project is to enable the FlexWork product on the USP platform. FlexWork supports employers with seasonal, part-time and variable-hour employees through different medical and financial protection offerings.

The Digital QA team will validate the impact of FlexWork across ACET, BEO, SPIRE and OAP. Testing will focus on application functionality, data visibility, user access, navigation, integration touchpoints and regression of existing functionality.

2. Testing Objectives

- Validate FlexWork-related functionality across ACET, BEO, SPIRE and OAP.
- Verify accurate display of customer, group, member, policy and benefit information.
- Validate linked Member Group functionality wherever applicable.
- Verify member self-service functionality through OAP.
- Validate access to EOBs, Check Summaries and ID card-related functionality.
- Verify integration between impacted digital applications and dependent systems.
- Ensure existing functionality for non-FlexWork customers is not impacted.
- Validate role-based access and protection of member-specific information.

3. Application Scope

3.1 ACET

ACET is used by Customer Service Representatives to access customer and group-related information.

- Customer search and retrieval.
- Customer and Member Group information display.
- FlexWork product and plan information.
- Linked Member Group identification and validation of customers with multiple Member Groups.
- Navigation or toggle functionality between linked Member Groups, where applicable.
- Stop Loss information display, subject to confirmation of the final requirement.
- Regression of existing customer service functionality.

3.2 BEO

BEO is the employer/broker-facing portal used to access group-level information and enrollment-related capabilities.

- Employer/Broker login and access.
- FlexWork group information display.
- MEC, MVP and Bridge-related information visibility.
- Member enrollment and benefit information.
- Product and subcontract option visibility.
- Linked Member Group toggle functionality.
- Policy and invoice information for applicable groups.
- Existing billing invoice and CSV report functionality regression.
- Regression of existing employer/broker portal functionality.

3.3 SPIRE

SPIRE is included in the Digital QA scope. However, the provided project document does not explicitly establish SPIRE-specific FlexWork functionality or impacts.

Proposed scope pending confirmation: identify FlexWork-related application changes; validate impacted screens, workflows, customer/group/member information and applicable integration touchpoints; perform regression of impacted existing functionality.

Detailed SPIRE test scenarios will be finalized after confirmation of application-specific requirements and impacted functionality.

3.4 OAP (Optum Adaptive Portal)

OAP is the member self-service portal for FlexWork.

- Member login and authentication.
- Member-specific plan and benefit information visibility.
- MEC, MVP and Bridge-related information, wherever applicable.
- EOB retrieval and document accessibility.
- Check Summary accessibility.
- Validation of EOB and Check Summary links directing members to OAP.
- ID card maintenance request submission and response validation.
- Appropriate ID card generation and presentation.
- Validation of existing hold conditions before ID card processing.
- Document availability and notification functionality.
- Branding and product-specific document presentation.
- Member-level authorization and data security.

4. In-Scope Testing

- Functional testing of ACET, BEO, SPIRE and OAP.
- FlexWork customer and group information validation.
- Member Group relationship and toggle functionality.
- Plan and benefit information visibility.
- Employer/Broker portal and member self-service functionality.
- EOB and Check Summary access and presentation.
- ID card request workflow through OAP.
- Document links, URLs and QR code validation.
- Application integration validation for impacted digital workflows.
- Role-based access, authorization, negative and boundary testing.
- Regression testing and cross-application data consistency validation.

5. Out-of-Scope Testing

- Medical claims adjudication calculations.
- Financial protection claims adjudication.

- Underwriting and pricing calculations.
- Financial reserve and Stop Loss calculations.
- Backend business logic implementation.
- Internal financial ledger validation.
- Database-level development and configuration changes.
- Detailed API implementation testing owned by backend teams.

Scope note: Backend claims calculations may be out of scope; however, availability, accessibility and correct presentation of generated EOBs and related documents through OAP remain in Digital QA scope.

6. High-Level Test Scenarios

6.1 ACET Scenarios

ID	Test Scenario	Priority
ACET-01	Verify customer search and customer details retrieval.	High
ACET-02	Verify FlexWork group information visibility.	High
ACET-03	Verify Member Group information associated with a customer.	High
ACET-04	Verify Linked Member Group ID information.	High
ACET-05	Verify navigation/toggle between linked Member Groups, if applicable.	Critical
ACET-06	Verify correct plan and product information display.	High
ACET-07	Verify Stop Loss information display as per confirmed requirements.	Medium
ACET-08	Verify existing customer service functionality through regression testing.	High

6.2 BEO Scenarios

ID	Test Scenario	Priority
BEO-01	Verify employer/broker login and access.	High
BEO-02	Verify FlexWork group information visibility.	High
BEO-03	Verify MEC, MVP and Bridge product information.	High
BEO-04	Verify member enrollment information.	High
BEO-05	Verify member benefit lines for applicable products.	High
BEO-06	Verify subcontract option visibility.	High
BEO-07	Verify Linked Member Group toggle functionality.	Critical
BEO-08	Verify policy and invoice information for applicable groups.	High
BEO-09	Verify existing billing invoices and CSV reports.	Medium
BEO-10	Verify existing rate presentation functionality through regression.	Medium

6.3 SPIRE Scenarios

ID	Test Scenario	Priority
SPIRE-01	Identify and validate FlexWork-related application changes.	TBC
SPIRE-02	Validate impacted customer/group information.	TBC
SPIRE-03	Validate impacted member and product information.	TBC
SPIRE-04	Validate applicable integration touchpoints.	TBC
SPIRE-05	Perform regression of impacted existing functionality.	TBC

6.4 OAP Scenarios

ID	Test Scenario	Priority
OAP-01	Verify member authentication and login.	High
OAP-02	Verify member-specific FlexWork plan information.	High
OAP-03	Verify MEC, MVP and Bridge-related information wherever applicable.	High
OAP-04	Verify EOB retrieval from DOC360.	Critical
OAP-05	Verify EOB document accessibility and presentation.	Critical
OAP-06	Verify OAP URL and QR code redirection from EOB.	High
OAP-07	Verify Check Summary accessibility.	High
OAP-08	Verify ID card maintenance request submission.	Critical
OAP-09	Verify appropriate ID card presentation for Bridge coverage.	Critical
OAP-10	Verify standalone EHIPP+NET ID card presentation, where applicable.	High
OAP-11	Verify ID card hold and release scenarios.	High
OAP-12	Verify document availability notifications.	Medium
OAP-13	Verify product branding and document presentation.	Medium
OAP-14	Verify unauthorized access to another member's documents is restricted.	Critical

7. Integration Testing Scope

Digital QA will validate the integration touchpoints relevant to the four applications. Testing will focus on the expected digital user journey and data presentation. Detailed API-level testing ownership will be aligned with the respective development and integration teams.

Source / Application	Target / Dependency	Validation
Cirrus	ACET	Customer, group and Member Group information.
Cirrus	BEO	Group, enrollment and benefit information.
Cirrus	OAP	Relevant member and plan information, as applicable.
DOC360	OAP	EOB and document retrieval.
OAP	Fulfillment Gateway Service	ID card maintenance request submission and response.
OFIN / document generation flow	EOB / Check Summary	Document URL, branding and messaging validation.
Linked Member Group data	ACET / BEO	Correct identification and switching between linked groups.
SPIRE	Applicable dependencies	To be confirmed based on SPIRE requirements.

8. Test Data Requirements

- FlexWork customer with a single Member Group.
- FlexWork customer with multiple linked Member Groups.
- Customer with MEC coverage.
- Customer with MVP coverage.
- Customer with Bridge coverage.
- Customer with standalone EHIPP+NET coverage, where applicable.
- Members with valid enrollment and benefit information.
- Members with available EOBs and Check Summaries.
- Members with different ID card request scenarios, including existing holds.
- Non-FlexWork customers for regression testing.
- Different user roles for access validation.

9. Test Environment and Dependencies

- Availability of ACET, BEO, SPIRE and OAP test environments.
- Valid test user credentials for all four applications.
- FlexWork customer, group and member test data.
- Access to required downstream systems and integrations.
- Availability of EOB and Check Summary test documents.
- Fulfillment Gateway Service connectivity for ID card request validation.
- Confirmation of SPIRE-specific requirements.
- Availability of business and technical teams for requirement clarification.
- Defect management and test execution tracking access.

10. Entry Criteria

- Requirements and impacted functionalities are available.
- Test environments are accessible and application changes are deployed to QA.
- Required test data is prepared.
- Required integrations are available.
- Test scenarios are reviewed and approved.
- No critical environment blockers exist.

11. Exit Criteria

- All planned high-priority test scenarios have been executed.
- Critical business workflows have passed.
- No open Critical or High severity defects remain without an agreed disposition.
- Integration and regression testing are completed.
- Failed scenarios are retested after fixes.
- Test execution results are documented.
- QA completion summary is shared with stakeholders.

12. Risks and Assumptions

Risk / Assumption	Impact / Action
SPIRE-specific FlexWork impacts are not established in the available project document.	Confirm SPIRE scope before finalizing detailed test scenarios.
OAP requires a new connection to Fulfillment Gateway Service.	Confirm integration availability and ownership.
Multiple Member Groups may be associated with one customer.	Validate correct group identification and switching.
EOB and Check Summary document changes may affect member experience.	Validate document access, URLs, QR codes and presentation.
Test data may not cover all FlexWork product combinations.	Prepare representative customer and member scenarios.
Some backend functionality is owned by other teams.	Align Digital QA and integration testing responsibilities.

13. Deliverables

- High-Level Test Plan.
- Detailed Test Scenarios and Test Cases.
- Test Data Requirements.
- Test Execution Results.
- Defect Reports and Retest Results.
- Regression Testing Summary.
- Final QA Sign-off / Test Completion Summary.
